

PPH / Pouch Machine for the pharmaceutical industry

PPH 80 – the pharmaceutical pouch machine

Hermetically sealed packaging of pharmaceutical powders and bulk material into pouches.

Description

With the pharmaceutical pouch machine PPH, Harro Höfliger has developed a machine platform for inline production and filling of pouches. The PPH pouch machine complies with GMP requirements to a maximum degree. Equipped with the most advanced regulation and control engineering, this packaging line is predestined for line integration and fully automatic production processes. The material is reel-fed, printed inline and linearly processed into a three-side sealed pouch. In the octagonal turret, the pouch is transferred, followed by the dosing process and subsequent weight check.

- All quality-relevant process steps are monitored separately
- The production room is fully guarded. There is no chance of the ambient production area being contaminated by active ingredients
- Suitable for the production of a variety of product options up to patent-specific preparations
- Integration of micro-dosing systems for bulk materials, powder and liquid
