

Ampoules & Vials Inspection Machine

The A&V series of fully automated inspection machines are developed to process ampoules, vials and cartridges filled with injectable solutions and freeze dried products.

They represent the ideal solution to comply with GMP requirements, and to ensure that parenteral products are essentially free of foreign particles.

The A&V Series machines can also integrate a dedicated module for leak testing based on the vacuum decay technology.

They can also be equipped with a number of additional inspection stations for additional controls relevant to the appearance of the container (cosmetic checks), and headspace analysers.
