

JTJ-2 Double-head Semi-Automatic Capsule Filling Machine

The utility model discloses a double-head spreading capsule device, which relates to the technical field of capsule devices. The double-head capsule sowing device comprises an operating table, wherein two bases are fixed on the top of the operating table, long blocks are welded on the tops of the two bases, a supporting block is welded on the top of the long block near one side edge, a conveying long block is welded on the top of the supporting block, and a material frame is fixed on the top of the conveying long block. According to the double-head capsule sowing device, the capsule pushing plate pushes the capsule in the capsule pressing groove to the edge of the capsule pressing groove by starting the second electric push rod, and the capsule enters the capsule groove at the top of the capsule disc by starting the motor, so that the capsule disc rotates. By repeating the above steps, the capsule can be effectively sown into the capsule groove.

Workshop:

- **Name of Base:** URBAN
- **Products:** NJP full automatic capsule filling machine, NJYF hard capsule liquid filling machine, sealing machine connecting line, semi-automatic capsule filling machine, capsule polishing machine, etc.
- **Certification obtained:** ISO CE FDA
- **Capacity:** 5500 capsules/min
