

Ophthalmic Filling Machine

The OFM Series filling and closing machines are suitable for both sterile and non sterile products, like ophthalmic solutions, syrups and nasal sprays.

They combine the accessibility of linear machines and the compact design of the proven monobloc systems.

These features, and the unidirectional air flow-compatible design makes the OFM Series machines also suitable for different containment technologies.

The filling section can be fitted with different dosing systems, like time-pressure, rotary and peristaltic pumps, pre-gas, gas and post-gas units, and CIP/SIP devices.

The OFM Series can also accommodate multiple closing stations, which enable rubber stoppers, droppers, pressure or screw caps, flare caps, caps for nasal spray containers, etc. to be processed.
