

SYFILL

Syringes and Cartridges Filling Machine

The SYFILL Series filling and closing machines has been specifically designed for the processing of pre-sterilized, nested syringes.

They have been developed to meet current pharmaceutical industry requirements and meet the most stringent demands in terms of safety and aseptic conditions.

The extremely compact design reduces expensive sterile area space, regardless this is within a conventional clean room or within a different containment system like a cRABS or an isolator.

A SCARA (Selective Compliance Assembly Robot Arm) unit is used to move the nests and secure an extremely accurate transport, filling precision, and adaptability to different formats and products.

The dosing system is equipped with precision rotary piston pumps (other options available). Stoppering is carried out with or without vacuum.
