

VFM Manipulator

Vials Filling Machine Manipulator

The VFM MANIPULATOR Series of filling and closing monobloc systems have been specially developed for production applications that call for a high degree of flexibility over a wide range of products, and small batches.

The use of robotic arms, specially designed for the aseptic environment, makes these machines suitable for processing vials, cartridges or pre-sterilized syringes, with no need of dedicated systems.

VFM MANIPULATOR Series machines can be serviced exclusively from one side. Their compact design reduces and optimizes the space requirements within the clean room.
