

Roller conveyor

Roller conveyor line is a common continuous conveying equipment, because of its obvious advantages, so that it can not only connect the production process, but also directly involved in the production process, so in the electronic, electrical, pharmaceutical, chemical, hardware, food, beverage, textile, building materials industry and all kinds of logistics transportation, especially in various processing, assembly, packaging, storage and other pipeline has been widely used.

Roller conveyor is applicable to all types of boxes, bags, trays and other pieces of cargo transport, bulk materials, small items or irregular items need to be placed in the tray or container for conveying. Can transport single piece weight of a large material, or bear a larger impact load, easy connection between the roller line filter, can be used more than one drum line and other transport equipment or special plane to form a complex logistics system, to complete various process needs. Can be used to achieve the accumulation of material stacking conveyor. Roller conveyor is simple in structure, high in reliability, easy to use and maintenance.
