

VFM Series

Vials Filling Machine

The VFM Series filling and closing machines can process up to 24.000 units per hour, depending on the filling volume and the type of closure.

The open and linear design of the workstations make the machine very accessible and offer the advantages of easy cleaning, fast size changeovers, and perfect integration with open or closed RABS, and isolator applications.

The filling section can be fitted with up to ten rotary pumps, pre-gas, gas and post-gas systems, and CIP/SIP devices.

The VFM Series filling and closing machines can be used as standalone units, or integrated into the line to guarantee maximum precision and safety in pharmaceutical manufacturing.
